Because of the high incidence of hypersensitivity disease of the immediate type in the general population, reagin-mediated disease is responsible for the majority of clinical immunologic problems seen in medical practice. The theoretical and practical aspects of these IgE-mediated diseases are discussed in detail. Diseases having similar reactions but which are probably not IgE-mediated are included as they are commonly referred to the Allergy specialist. These include certain types of asthma, urticaria and rhinitis. Drug reaction problems are included as it is a common and growing problem in clinical practice of allergy. It is in this area that the current view of the immune system has arisen and developed. There is indeed little doubt that immune reactions are primarily determined by messages which are generated within the immune system******

and passed among different types of immunologic cells. This cell communication not only determines the type, intensity and duration of the response after perturbation of the immune system by exogenous antigens, but it is also essential for preventing autoimmune reactions and their clinical consequences. In order to assure a perfect balance within the enormous complexity of the immune system, it is not surprising that multiple self-regulatory mechanisms are organized at different levels, such as antibody feedback, idiotypic-anti-idiotypic responses, suppressor and helper T cells, lymphokine signals and genetic requirements. A number of observations in recent years have, however, demonstrated that consistent contributions to the immunological homeostasis are given also by signals generated outside of the immune system, namely, in the central and autonomous nervous system as well as in the endocrine apparatus. Furthermore, the interactions between the immune system and the other body homeostatic mechanisms seem to be bidirectional: if immunological cells may be targets of neuroendocrinological factors, immunological products seem in turn to contribute to the neuroendocrine homeostasis.

Allergic Diseases Diagnosis and Treatment [Springer Science & Business Media](#) It hardly seems that three years have passed since the publication of the first edition of *Allergic Diseases: Diagnosis and Treatment*. We are gratified that it was enough of a success to warrant the second edition. As with the first, this edition is intended for the "front-line" physician who cares for the allergic patient. We have tried, once again, to make it as "user friendly" and clinically oriented as possible. Our approach to the principles of pathophysiology is intended to allow them to be easily applied to the rationale for therapy. The major intent therefore is still to help the primary care physician deal with the day-to-day management of the allergic patient. The arrangement of this text is similar to that of the first edition, with the major emphasis being on common allergic diseases and the pharmacologic tools we use to control them. To this end two new chapters have been added, one on antihistamines and the other on antileukotrienes. In addition, a new chapter has been added to help the physician deal with the child who experiences recurrent respiratory tract infections. Many of the authors, because of the superb job they did with their first contributions, have been asked for an encore. However, to keep our approach fresh, some of these authors have been asked to write different chapters, and new contributors have been solicited.

Allergy in Practice [Springer Science & Business Media](#) Allergy is one of the major health problems of most modern societies. Although allergic diseases are well-known for almost two hundred years, their prevalence has increased dramatically over the last decades. Allergic reactions manifest in various organs, most commonly in the skin and mucous membranes, the frontier surfaces where the contact between the individual and the environment takes place. In a very concise and practical way this book covers all aspects of allergic reactions from pathophysiology to diagnosis, therapy and prevention with a strong focus on relevant aspects for the everyday work of the practising dermatologist and allergist in the hospital or office. This book reflects the rich personal experience of a German allergist with international training and reputation, who is active in immunology and allergy research and practice for almost 30 years. In this book, not only IgE-mediated allergic reactions are covered but all other kinds of allergies such as atopic eczema, contact dermatitis, drug eruptions, anaphylaxis and food allergies are equally represented as well as psychosomatic aspects and problems of environmental intolerances.

Compare this with **Allergy Frontiers: Epigenetics, Allergens, and Risk Factors**, the present s- volume text with well over 150 contributors from throughout the world. This book captures the explosive growth of our specialty since the single-author textbooks referred to above. The unprecedented format of this work lies in its meticulous attention to detail yet comprehensive scope. For example, great detail is seen in manuscripts dealing with topics such as “Exosomes, naturally occurring minimal antigen presenting units” and “Neuropeptide S receptor 1 (NPSR1), an asthma susceptibility gene.” The scope is exemplified by the unique approach to disease entities normally dealt with in a single chapter in most texts. For example, anaphylaxis, a topic usually confined to one chapter in most textbooks, is given five chapters in **Allergy Frontiers**. This approach allows the text to employ multiple contributors for a single topic, giving the reader the advantage of being introduced to more than one vi- point regarding a single disease. **Pediatric Allergic Diseases Focus on Clinical Diagnosis Allergic Diseases Allergy Proceedings The Official Journal of Regional and State Allergy Societies. 1985/1987 Orphan Lung Diseases A Clinical Guide to Rare Lung Disease** [Springer](#) **Orphan Lung Diseases: A Clinical Guide to Rare Lung Disease** provides a comprehensive, clinically focused textbook on rare and so-called ‘orphan’ pulmonary diseases. The book is oriented towards the diagnostic approach, including manifestations suggesting the disease, diagnostic criteria, methods of diagnostic confirmation, and differential diagnosis, with an overview of management. **Trends in Allergic Conditions Among Children United States, 1997-2011 Global Atlas of Allergic Rhinitis and Chronic Rhinosinusitis Asthma and the other allergic diseases Applied Dermatotoxicology Clinical Aspects** [Academic Press](#) **Applied Dermatotoxicology: Clinical Aspects** provides concise, systematic, and state-of-the-art information on the toxicological effects of substances on skin, and recent advances in dermal toxicity testing. This book specifically addresses the clinical presentations borne out of exposure to a variety of chemicals. It begins with an overview of skin biology to provide toxicologists with a basic understanding of its anatomy and physiology. Next it presents a variety of dermatotoxicological effects, as well at the toxic agents that cause them, with color photographs to illustrate these effects. **Applied Dermatotoxicology: Clinical Aspects** is an essential reference for toxicologists in industry, and for those medical professionals who encounter cases of dermal exposure to toxic agents. A concise, yet inclusive review of effects of chemical exposure Includes background on basic skin biology Provides vital clinical reference for toxicologists in non-clinical settings **Forensic Pathology Reviews Vol 3** [Springer Science & Business Media](#) A collection of cutting-edge accounts of special topics from various fields of forensic pathology and death scene investigation. The authors offer critical insight into the medicolegal investigation of bodies found in water, the forensic aspects of the human immunodeficiency virus (HIV)-1 infection of the central nervous system, deaths in a head-down position, and forensic bite mark analysis. Additional chapters address taphonomic changes in human bodies during the early postmortem interval, arrhythmogenic ventricular dysplasia that produces sudden death in young people, the postmortem diagnosis of death in anaphylaxis, and iatrogenic deaths. The forensic aspects of suicide, murder-suicide, and suicide trends in the United States are also discussed, along with the evaluation of fatal pulmonary thromboembolism and the use of radiology in medicolegal investigations. **Allergic Diseases from Infancy to Adulthood** [W.B. Saunders Company](#) **How to Make Disease Disappear** [HarperCollins](#) A much-needed program to prevent and reverse disease, and discover a path to sustainable, long-term health from an acclaimed international doctor and star of the BBC program **Doctor in the House**. **How to Make Disease Disappear** is Dr. Rangan Chatterjee’s revolutionary, yet simple guide to better health—a much-needed, accessible plan that will help you take back control of your health and your life. By making small, incremental changes in each of these key areas, you can create and maintain good health—and alleviate and prevent illness. As Dr. Chatterjee, reveals we can reverse and make disease disappear without a complete overhaul of our lifestyle. His dynamic, user-friendly approach is not about excelling at any one pillar.
